

# Markdown Test Document

## Testing extract\_markdown() vs extract\_text()

By Test Author

This document tests the difference between `extract_text()` and `extract_markdown()`. The `extract_text()` function should return plain text without Markdown formatting. The `extract_markdown()` function should return properly formatted Markdown with headings marked with `#`, links with `[text](url)` syntax, and lists with `-` or `1.` syntax.

### Key Features

- Feature one: Text extraction from PDFs
- Feature two: Markdown formatting support
- Feature three: Link preservation
- Feature four: List detection
- Feature five: Table extraction

### Implementation Steps

1. Parse the PDF content stream
2. Extract text spans with metadata
3. Detect block types (heading, paragraph, list)
4. Format blocks as Markdown
5. Return the complete Markdown output

### Sample Table

| Name             | Type     | Description                     |
|------------------|----------|---------------------------------|
| extract_text     | Function | Returns plain text from PDF     |
| extract_markdown | Function | Returns Markdown formatted text |
| Markdown         | Format   | Lightweight markup language     |
| PDF              | Format   | Portable Document Format        |
